Front Mounting Adaptors	82

PUMP DRIVES

MAX INPUT POWER

SINGLE PUMP DRIVES

AM 110 - 180 kW

DOUBLE PUMP DRIVES

AM 216 - 205 kW

AM 220 - 355 kW

AM 230 - 430 kW

AM 232 - 565 kW

TRIPLE PUMP DRIVES

AM 320 - 205 kW

AM 330 - 355 kW

AM 345 - 430 kW

AM 365 - 670 kW

FOUR PUMP DRIVES

AM 450 - 640 kW

AM 480 - 700 kW

GENERAL INFORMATION

CHARACTERISTICS

The pump drives allow the contemporary running of one or more hydraulic pumps from a single prime mover.

All models can be prepared for various applications:

- basic (B) for independent mounting
- with a overcenter industrial clutch (BD) (BDS)
- with housing and coupling connection for diesel engines.

Constructively the pump drives consist of:

- cast iron casing
- straight-tooth gears, case hardened
- hardened grinded (shaved in series AM 216 - AM 320)
- ball bearings
- shafts in case-hardening steel - case hardened - hardened
- viton seals on input shaft
- the kinematic diagram is identical for the various models: the primary gear, which transmits the drive to the secondary gears on whose axles the pumps are applied, is splined to the input shaft. The direction of rotation in output is the opposite of the rotation direction in input
- the transmission ratio is identical on all the outputs.

TECHNICAL DATA

- Ratio

It represents the ratio between the input speed (speed of the prime mover) and the output speed (speed of the pumps).

Ratios lower than 1 indicate a pump drive unit performing as speed increaser, higher than 1 as speed reducer.

- Max input torque M1 (Nm)

It is the maximum torque which may be transmitted on input, corresponding to a theoretically unlimited gear life and to a bearing life (L10) of 10.000 hours at least.

For clutch coupled units, or when RBD coupling is mounted, the max input torque may be limited by the clutch or the RBD torque capacity.

- Each output max torque M2 (Nm)

It represents the maximum torque which may be transmitted on each output.

- Max speed n1 (RPM)

It is the maximum rotation speed at the input shaft. In case of clutch coupled unit, test that working speed is not more than the maximum permitted for the clutch.

- Moment of inertia J (Kgm²)

It is referred to the input shaft and it is calculated in accordance with ISO standards.

SELECTION

The fundamental elements on which the choice of pump drive is based are:

- number and type of hydraulic pumps to be applied
- max torque absorbed by the pump (or by the group of pumps) on each output of the pump drive
- max power entering the pump drive
- Depending on the overall dimensions of the pumps, complete with pipes fittings, it is possible to establish the minimum distance between the pumps themselves.
Comparing these values foreseen in the catalogue for the output shafts, it is possible to make a choice of type.
- Verify that the torque value of each output is kept below the max. value shown in the catalogue for the chosen pump drive.
In cases of use in important industrial systems or in marine applications, it is necessary to bear in mind relevant safety factors.
Also verify that the rotation speed of input shaft isn't more than the max. indicated in the catalogue.
In the case of pump drives with clutch BD or BDS verify that the max. input torque is at least 20% below the max. transmittable from the clutch.
- Figure 1 shows the max input power advisable according to the pump drive model.

COOLING

Oil working temperature must not exceed 105°C.

Depending on the input power and on duty, a cooling system may be necessary.

It is advisable to check the oil temperature during the first hours of work, making sure that the oil doesn't exceed 105°C.

All pump drives, except for AM 216 and AM 320, can be equipped on request with a cooling system consisting of an oil circulating pump mounted on the input shaft, pumps side, an oil/water cooler and relevant pipe fittings.

DIESEL ENGINE CONNECTION

In cases of application to diesel engines, the pump drives can be supplied with housing and coupling suitable for engines with flywheel and flywheel housing dimensions according to SAE standards.

An example sketch of the dimensions to be checked is given in fig. 2.

The same dimensions are valid for connections with clutches.

The clutch pilot bearing (to assemble between the flywheel on the clutch shaft) is not included in the supply.

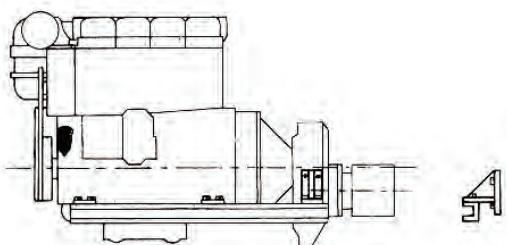

INSTALLATION

The working position of the pump drive is usually the one shown in the catalogue.

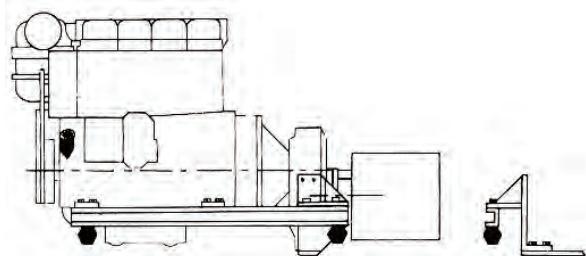

If other positions are requested it is necessary to contact our Tech. Dept.

Special care must be taken over the fixing of the pump drive.

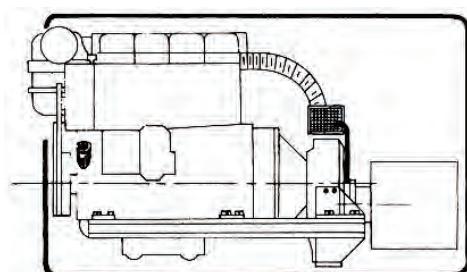

APPLICATION EXAMPLES

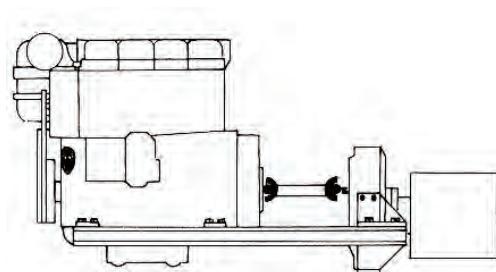

AM Pump Drive with pumps weight less than 100 kg.
Normal support bracket.

AM Pump Drive with total pumps weight more than 100 kg.
The support bracket must be close to pump drive/pumps center of gravity.

AM Pump Drive in closed surrounding without ventilation. A cooling system is needed.

AM Pump Drive with cardan joint.
The support bracket must be close to pump drive/pumps center of gravity.

LUBRIFICATION

Use gear lube with EP additive and minimum viscosity index of 95.

The oil choice may be made taking account of the ambient temperature, as per tab. 3.

The pump drives are supplied without oil.

Before use fill to the maximum level mark on dipstick.

The oil quantity indicated in the catalogue is approximate.

Oil must be replaced after the first 50 working hours.

Subsequent oil changes should be made every 1.000 hours or every 12 months, whichever is the sooner.

Check regularly the oil level.

Oil working temperature must not exceed the 105°C.

RECOMMENDED OIL TABLE

Ambient Temperature		Mineral Oil -15°C / +25°C	Mineral Oil -5°C / +40°C	Syntetic Oil -25°C / +80°C

LOAD CLASSIFICATION BASED UPON AGMA LOAD CHARACTERISTICS

PRIME MOVER	DURATION OF SERVICE	DRIVEN MACHINE LOAD CLASSIFICATION		
		UNIFORM	MODERATE SHOCK	HEAVY SHOCK
Electric motor	Up to 3 hours per day	1.00	1.25	1.50
	3–10 hours per day	1.00	1.25	1.75
	Over 10 hours per day	1.25	1.50	2.00
Multi-cylinder internal combustion engine	Up to 3 hours per day	1.00	1.25	1.75
	3–10 hours per day	1.25	1.50	2.00
	Over 10 hours per day	1.50	1.75	2.25
Multi-cylinder internal combustion engine with high torque rise	Up to 3 hours per day	1.50	1.75	2.25
	3–10 hours per day	1.75	2.00	2.50
	Over 10 hours per day	2.00	2.25	2.75
Single cylinder internal combustion engine	Up to 3 hours per day	1.25	1.50	2.00
	3–10 hours per day	1.50	1.75	2.25
	Over 10 hours per day	1.75	2.00	2.50

TO CALCULATE APPLICATION TORQUE:

$$\frac{5252 \times \text{HP}}{\text{Engine speed (n/min.)}} = \text{Torque}$$

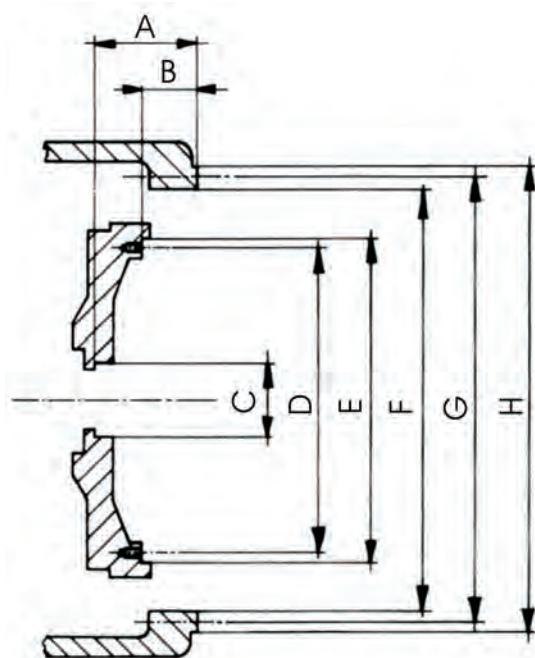

Torque x load factor = Application Torque

Use load factor from chart at left

All clutch engagements to be with prime mover below 1000 n/min.

High inertia loads may require use of larger clutch.

Contact our application engineering dept. for assistance.

FLYWHEEL / FLYWHEEL HUSING DIMENSIONS - SAE J620 D / SAE J617 C

SPEED REDUCING (INCREASING) GEARBOXES

RM SPEED REDUCING (INCREASING) GEARBOXES

DESCRIPTION

RM gearboxes have been specially designed to couple Diesel engines; they allow to operate an utilizer (water pump, compressor, fan...) requiring an input speed different from the Diesel engine speed.

Constructively the RM gearboxes consist of:

- cast iron casing (aluminium alloy on RM 20)
- helical tooth, case-hardened, shaved (grinded on RM 150) gears
- shafts are manufactured from high quality steel, case hardened
- taper roller bearing on output shaft
- the input shaft is supported by a single bearing inside the casing and therefore it must be driven by a pilot bearing assembled on the flywheel, in case of close coupling to Diesel prime mover.
- RM series includes 6 models and each of them may be provided with an output rotation direction equal to that of input (RM ... S), or with opposite direction to that of input (RM ... D).
- RM ... D: reverse rotation units have a primary gear on the input shaft driving directly onto the secondary gear powering the output shaft.
- RM ... S: same rotation version have an idler gear between primary and secondary gears.
- RM gearboxes may be equipped for close coupling to Diesel engines with:
 - overcenter clutch (BD) with SAE housing
 - SAE housing and rigid or flexible coupling (GR, GE).
- Freestanding mounting is possible in the BDS execution.

TECHNICAL DATA

- Ratio I

It represents the ratio between the input speed (Diesel engine speed) and the output speed (utilizer speed).

Ratios lower than 1 indicate a gearbox performing as speed increaser, higher than 1 as speed reducer.

- Max. input torque Me

It is the maximum torque which may be transmitted on input, corresponding to a theoretical unlimited gear life and to a bearing life (L10) of 5000 hours at least, with an input speed of 2000 RPM. For clutch/gearbox combination, the max input torque may be limited by the clutch capacity.

- Max. input speed Ne

It is the maximum speed at the input shaft. For clutch/gearbox combination, the max input speed may be limited by the clutch.

- Max. power P

It is the maximum power that may be transmitted under normal conditions, without an oil cooling system.

The values shown are only indicative, many external factors may create much influence, such as: air temperature, possibility of air circulation, environment conditions.

When the power is higher than the listed value a cooling system is necessary.

SELECTION

RM unit selection should be made by taking the input torque and be multiplying it by the service factor:

1,0 - light duty (centrifugal pumps, fans).

1,5 - duty (4 cyl. compressors, conveyors, hydraulic pumps).

2,0 - heavy duty (2 cyl. compressors, mixers, presses).

2,5 - very heavy duty (1 cyl. compressors, mills).

The resulting torque is to be lower than the listed value (**M_e**) for selected gearbox type and ratio.

For clutch gearbox combination, the max input torque may be limited by the clutch capacity: see table

TECHNICAL DATA FOR CLUTCHES.

LUBRIFICATION

- Use SAE 90 with EP additives - units are supplied without oil; before use fill to the maximum level mark on dipstick.
- Oil must be replaced after the first 100 working hours. Subsequent oil changes should be made every 1000 hours or every 12 months, whichever is the sooner.
- Check regularly the oil level.

COOLING

The maximum oil temperature during continuous operation must not exceed 95°C.

It is wise to check this temperature during the first working hours.

If recommended maximum power limits are to be exceeded, RM models 120 and 150 are available with oil cooling system.

ORDER CODE

RM... BDS SPEED REDUCING (INCREASING) GEARBOXES

Allowable side-pull loads on the output shaft

$$F = \frac{1910 \times kW}{n \times D} \times f \times f_1$$

F = Radial Load (dN)

kW = Input Power (kW)

n = Output shaft speed (n/min.)

D = Pulley Pitch diameter (m)

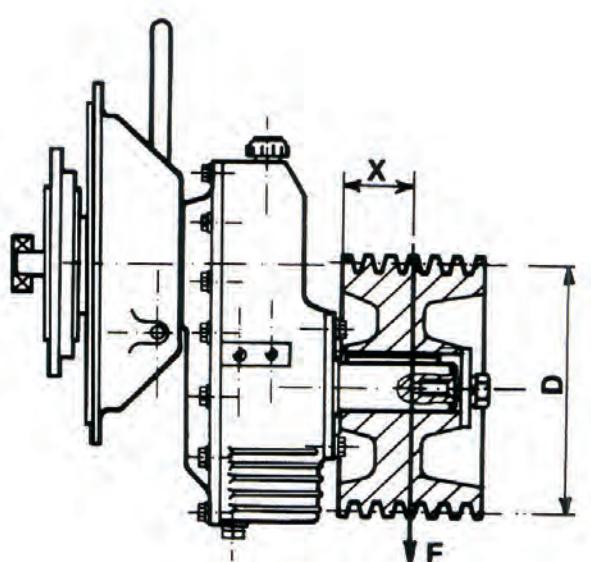

f = 1,0 - Load factor for chain or gear drive

2,5 - Load factor for V belts

3,5 - Load factor for flat belts

f_1 = 2 - Load factor only for reciprocating compressor or severe shock drives

The resulting value of F must be lower or equal to that quoted on the table, according to the X distance.

MECHANICAL POWER TAKE-OFF

TECHNICAL FEATURES

The power take-off series "BD" may be coupled directly to Diesel engines with SAE flanges.

They can be used for a variety of industrial applications where there is a need to disengage movement from the engine to the driven unit, such as the drives of compressor, fans, pumps.

The mechanical controlled dry-disc clutch is equipped with a housing and supported by a shaft.

"BD" series range consists of single-disc clutch of 6½" - 7½" - 8" - 10" - 11½", double-disc clutch of 11½" - 14" and triple-disc clutch of 11½" - 14" and 18".

"BD" series power take off covers a power range between 15 and 700 kW.

SELECTION

Selection of the clutch should be made considering the following issues:

- type of engine
- type of driven equipment
- number of engagement per hour
- absorbed power **P** (kW) by the driven unit and relevant speed **n** (n / min.)
- maximum rotation speed

The selection has to be made comparing maximum torque value that may be transmitted by the clutch, indicated with **T** in the catalogue and maximum torque value absorbed by the driven unit **T_a** multiplied by service factor **S** (see table below).

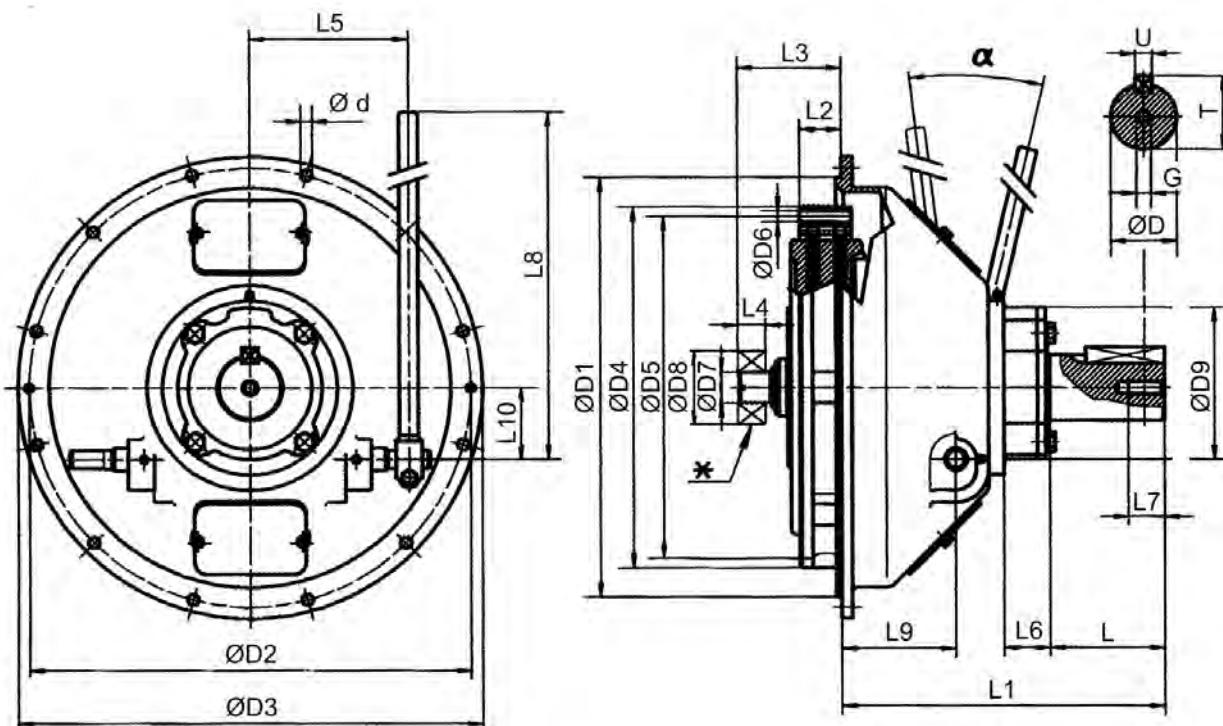

$$\frac{T_a \text{ (Nm)}}{P \text{ (kW)}} \times 9550 = n \text{ (n/min)}$$

$$T_a \text{ (Nm)} \times S < T \text{ (Nm)}$$

Driven Equipment	Engine			
	Diesel 1-2 Cylinders Engine	Diesel 3-4 Cylinders Engine	Diesel 6 Cylinders Engine	Electric, Turbine
	Service factor S			
Low WR2 equipment and torque demand curve similar to centrifugal pumps. Mechanism operate one or more hours before disconnecting. centrifugal pump ventilator blowers/fans hydraulic pump generators cooling circuit pump firefighting pump	1,1	1,25	1,3	1,4
Medium/low WR2 equipment and with low frequency of torque demand peaks. Clutch engaged max. 5 times each hour. 4 cylinder compressor marine equipment excavator backhoe loaders	1,2	1,5	1,6	2,0
Medium/high WR2 equipment. The clutch must engage within 3 seconds. Clutch engaged max. 10 times each hour. 2 cylinder compressors mills concrete mixers wood chippers	1,6	2,1	2,3	2,7
High WR2 equipment and/or with high frequency of torque demand peaks and/or clutch engaged more than 10 times each hour. The clutch must engage within 4 seconds. Single cylinder compressors Crushers or impact load machines	2,2	2,8	3,1	3,6

BD - BDS MECHANICAL CLUTCHES

Allowable side-pull loads on the output shaft

$$F = \frac{1910 \times kW}{n \times D} \times f \times f_1$$

F = Radial Load (dN)

kW = Input Power (kW)

n = Output shaft speed (n/min.)

D = Pulley Pitch diameter (m)

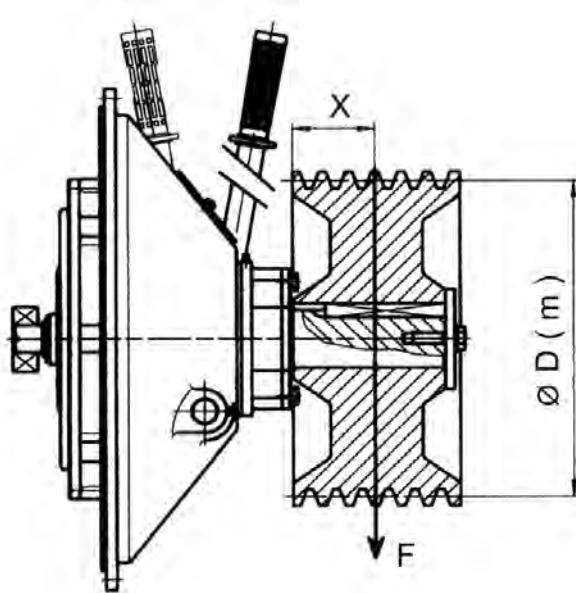

f = 1,0 - Load factor for chain or gear drive

2,5 - Load factor for V belts

3,5 - Load factor for flat belts

 $f_1 = 2$ - Load factor only for reciprocating compressor or severe shock drives

The resulting value of F must be lower or equal to that quoted on the table, according to the X distance.

HYDRAULIC POWER TAKE-OFF

HYDRAULIC POWER TAKE-OFF - PFI 60

SPECIFICATIONS

Multiple disc clutch in oil bath, hydraulically operated with 24V electric selector for remote control.

Versions: input cylindric shaft; output cylindric shaft or female splined shaft for hydraulic pump connection.
SAE 3-2-1 housing or free standing mounting possibilities.

Input rotation: right or left hand (to be specified with order).

Cooling: oil must be cooled by an external heat exchanger.

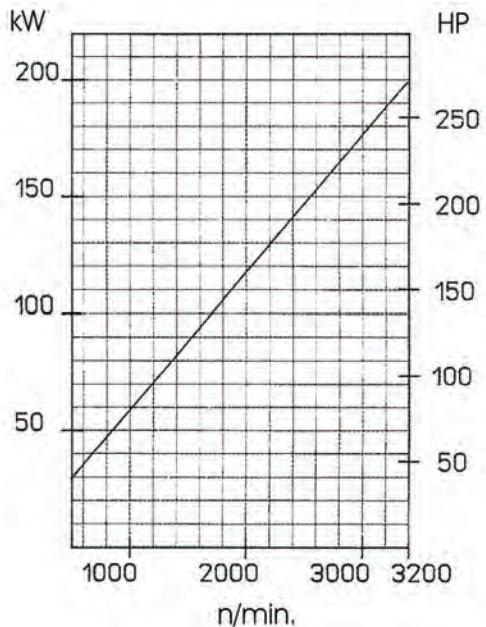

TECHNICAL DATA

- Max. Torque 600 Nm
- Max. Speed 3200 n/min.
- Weight 80 kg.

P.T.O. selection is to be made multiplying the net input power by the service factor:

- 1,0 for centrifugal pumps
- 1,3 for hydraulic pumps
- 1,5 for direct winch drivers
- 2,0 for crushers

SPECIFICATIONS

Multiple disc clutch in oil bath, hydraulically operated with mechanical or 12V or 24V electric selector for remote control.

Versions: input cylindric shaft; output cylindric shaft or female splined shaft for hydraulic pump connection. SAE 3-2-1 housing or free standing mounting possibilities.

Input rotation: right or left hand (to be specified with order).

Cooling: oil must be cooled by an external heat exchanger.

TECHNICAL DATA

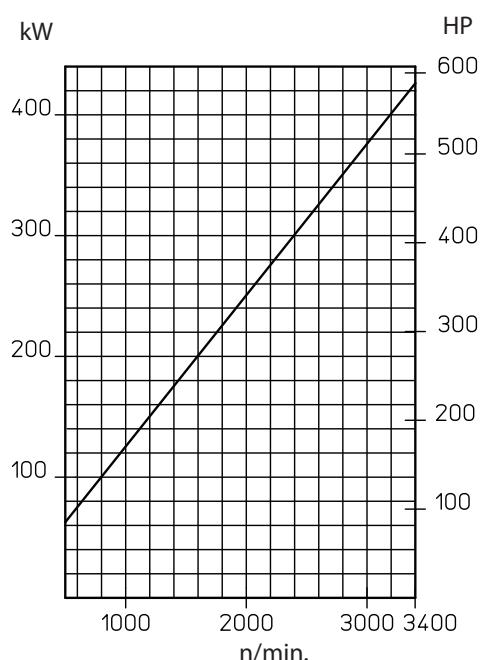

- **Max. Torque** 1200 Nm
- **Max. Speed** 3000 n/min.
- **Weight** 100 kg.

P.T.O. selection is to be made multiplying the net input power by the service factor:

- 1,0 for centrifugal pumps
- 1,3 for hydraulic pumps
- 1,5 for direct winch drivers
- 2,0 for crushers.

The resulting power is to be below the line on the graph.

PUMP DRIVE ADAPTORS

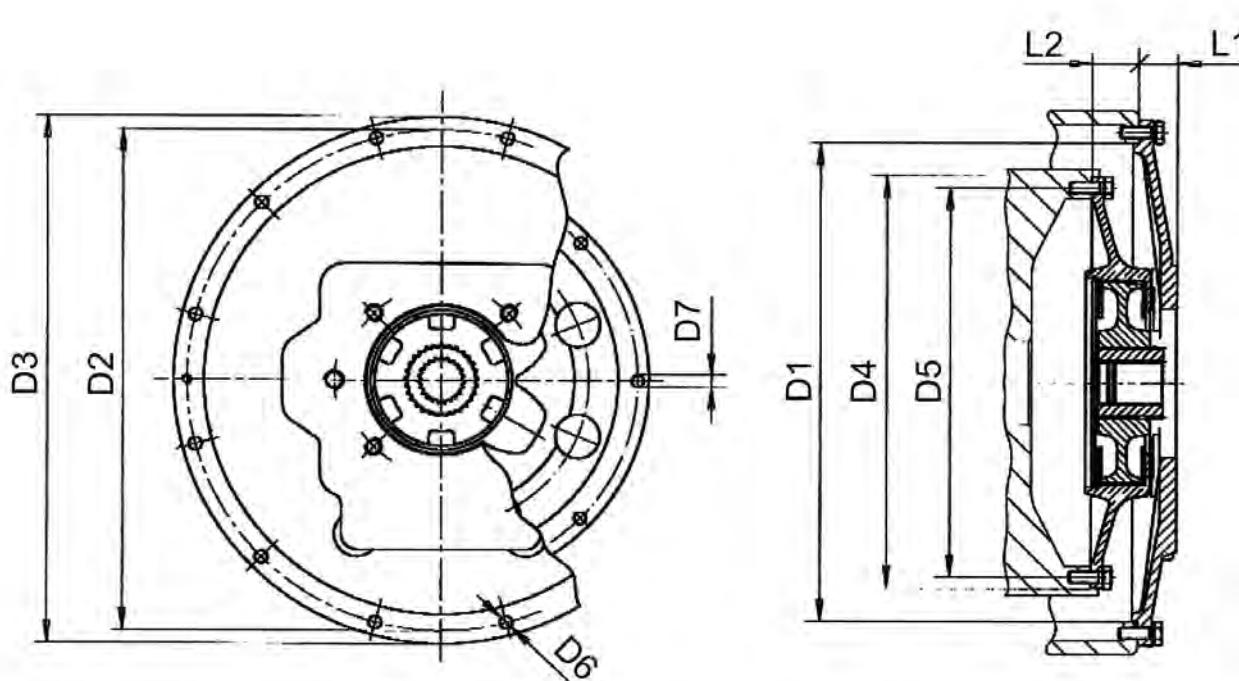

BELL HOUSINGS AND COUPLINGS FOR HYDRAULIC PUMPS

INTRODUCTION

Thanks to the availability of bell housings and couplings, we can offer a complete kit to couple a wide range of hydraulic pumps having SAE, ISO or CETOP flanging to Diesel engines equipped with flywheel-housing and flywheel according to SAE specification.

The couplings are made of an external part of aluminium alloy and internal part of steel with intermediate rubber elements.

The connection to the pump shaft is allowed by means of one or more splined hubs.
